

**ERR / Gy**

Excess relative risk  
per gray (acute radiation)

Life Span Study

**ERR / Sv**

Excess relative risk  
per sievert (fallout dose)

Semipalatinsk

**Incidence ratio**

Observed new cases vs  
comparison population

U.K. Gulf War (IRR 0.99)

**Mortality ratio**

Observed deaths vs  
comparison population

Khamisiyah brain cancer

DO NOT POOL

**Modeled risk**

Lifetime air-toxics cancer  
risk (not observed cases)

"Cancer Alley" VOC models

**Policy presumption**

Disease list recognized  
for compensation

PACT Act conditions

**Ecological ASIR ratio**

Region-level age-standardized  
incidence contrast

Saudi Eastern Prov. (5.7x)

**Why this matters:**

A modeled lifetime-risk estimate, a dose-response slope, an observed incidence ratio, and a policy list are different quantities with different units and assumptions. Combining them into a single benchmark number would be a reviewer-identified flaw. They are therefore compared only by direction and evidence grade, never by magnitude.
